DressMe — Project Objectives

Project: DressMe — Personal Fashion Assistant **Based on:** Personas Amine Trabelsi, Yasmine Ben Salah, Sami Belhadj

---

Recap — The 3 Personas and Their Goals

Persona	Core Driver	Short-term Goal	Long-term Goal
Amine Trabelsi	Avoiding waste / tight budget	Know whether an item is worth buying before purchasing	Build a coherent wardrobe without wasting money
Yasmine Ben Salah	Daily efficiency	Quickly find a suitable outfit every morning	Optimize her wardrobe, always have a coherent look
Sami Belhadj	Personal brand / credibility	Build a recognizable “signature” outfit	Build a strong personal brand through style

These three profiles cover three non-overlapping axes: **budget constraint**, **time constraint**, and **identity positioning**. Together they form a solid foundation for defining the project’s business and data science objectives.

---

1. Business Objectives

1. **Reduce daily decision time** spent on the wardrobe — aim for a significant reduction in the time spent choosing an outfit each morning (a core pain point for Amine and Yasmine).
2. **Reduce regretted or incompatible purchases** by providing decision support before the purchase, not after (Amine, Sami).
3. **Increase the value extracted from the existing wardrobe** — maximize the number of outfit combinations suggested from items already owned, rather than systematically pushing new purchases.
4. **Strengthen style confidence and consistency** for the user over time (Yasmine, Sami).
5. **Adapt the value proposition to the Tunisian context** — local budget, seasonality, and brand availability.

---

2. Data Science Objectives

1. **Automatic clothing classification** (category, color, season, style) from photos — digitizing the wardrobe via computer vision (CNN).
2. **Compatibility scoring model** between an item — existing or considered for purchase — and the rest of the wardrobe, directly addressing Amine’s need and Yasmine’s user journey (checking before buying).
3. **Outfit recommendation system** (outfit matching) combining style rules with learned user preferences.

4. **Wardrobe gap detection** — identifying missing pieces that would maximize the number of possible combinations, useful for strategic purchasing (Amine, Sami).
5. **User style profiling** (clustering / style embedding) — personalizing recommendations depending on whether the user is seeking efficiency (Yasmine), economy (Amine), or personal branding (Sami).
6. **Contextual model** (weather, occasion, calendar) to suggest the outfit of the day — particularly relevant for Yasmine.
